

Valve - Brass 1 NPT VBPR10

RG20141

Details

The VBPR Series cast brass pressure regulating valves are suited to special irrigation purposes. They are designed to reduce and regulate elevated pressures to more usable pressure ranges without adversely reducing the flow through the valve. This valve can thus be used as a master mainline pressure regulating valve or as an individual circuit control valve to equalize pressure throughout an irrigation system. Pressure regulation and equalization greatly improve sprinkler and drip performance. These pressure regulating valves are ideal for irrigation systems with contaminated water where precise control of downstream operating pressures is important.
